

#Jenny

Finally I get this ebook, thanks for all these I can get now!

#Rio

Cool! I'am really happy

#Markus Jensen

I did not think that this would work, my best friend showed me this website, and it does! I get my most wanted eBook

#Hun Tsu

wtf this great ebook for free?!

#Che Salsa

My friends are so mad that they do not know how I have all the high quality ebook which they do not!

#Diego Butler

so many fake sites. this is the first one which worked! Many thanks

COMPACTNESS

6.1 COMPACT SPACES

178 Compact Subsets

► EXERCISE 108. A subset E of X is compact if every cover of E by open subsets of X has a finite subcover.

REMARK (see 2011, p. 94). To say that a subset of a topological space is compact is to say that it is a compact space when endowed with the subspace topology. In this situation, it is often useful to extend our terminology in the following way: if X is a topological space and $A \subset X$, a collection of subsets of X whose union contains A is also called a cover of A if the subsets are open in X . We sometimes call it an open cover of A . We try to make clear in each specific situation which kind of open cover of A is meant: a collection of open subsets of a whole union is A , or a collection of open subsets of X whose union contains A .

PROOF. The "only if" part is trivial. So we focus on the "if" part. Let \mathcal{U} be an open cover of E , i.e., $E \subset \bigcup_{U \in \mathcal{U}} U$. For every $e \in E$, there exists an open set U_e in \mathcal{U} such that $e \in U_e \cap E$. Then $\{U_e \cap E : e \in E\}$ is an open cover of E . Let $\mathcal{C} \subset \{U_e \cap E : e \in E\}$. Then there exists a finite subcover, say U_1, \dots, U_n of $\{U_e \cap E : e \in E\}$, such that $E \subset \bigcup_{i=1}^n U_i$. Hence, $E \subset \bigcup_{i=1}^n U_i \cap E$ that is, E is compact. \square

► EXERCISE 109. The union of a finite collection of compact subsets of X is compact.

PROOF. Let A and B be compact, and \mathcal{U} be a family of open subsets of X which covers $A \cup B$. Then \mathcal{U} covers A and there is a finite subcover, say, U_1^A, \dots, U_m^A of A . Similarly, there is a finite subcover, say, U_1^B, \dots, U_n^B of B . But then $U_1^A, \dots, U_m^A, U_1^B, \dots, U_n^B$ is an open subcover of $A \cup B$, so $A \cup B$ is compact. \square
